e-Government serving citizens 24/7

Citizen-Government Relations

Citizen-Government Relations

The e-Government services with the largest impact on citizens are the Internet civil application and petition. These services allow citizens to file petitions and print out certificates from home without having to visit government offices. Korea's e-Government not only handles these services in a timely manner but also facilitates the participation of citizens using information disclosure and opinion gathering, through which the feedback is applied to enhance the reliability of policies.

16 One-Stop Civil Service Portal (Government24)

The People's Online Petition & Discussion Portal (e-People)

This system is a major government-wide online communication channel where all civil petitions, proposals, complaints or reports and policy discussions are conveniently filed and processed on the Internet.

System Features

One-stop processing

Once a petition or a proposal is filed, the system relays it to the most relevant institution for one-stop processing. It also administers a feedback satisfaction assessment to improve the service quality.

- Some 920 institutions – all administrative institutions (central government ministries, local government offices, educational offices and overseas diplomatic offices), judicial organizations and public institutions – are integrated and interconnected.

Easy addition of new administrative institutions and service expansion

The number of participating organizations increased from 7 in 2005 to 924 in 2017, with service additions including petition/proposal filing and policy engagement (2005), government waste report (2011) and public interest report (2012).

Big data analysis service

The system monitors people's opinions and identifies frequently-filed or rapidly increasing requests, which are then transferred to relevant institutions for complaint prevention and an early resolution.

Site Map

Non-structured public services and different types of reports such as civil petition, citizen proposal, policy engagement, government waste report, and public interest report

Public Information Sharing System

This system facilitates sharing and electronic handling of information among administrative, public, educational and financial institutions to ensure the convenience of citizens and the work efficiency of the government.

System Features

Information inquiry service

The system allows public officials to view and confirm documents (administrative information) for themselves, which are otherwise required to be submitted in paper by citizens requesting public services.

Information distribution service

When administrative institutions need to obtain information held and managed by other institutions in order to handle affairs required by law, such information can be shared and provided through the system.

Site Map

Information required for handling 2,495 businesses, including passport issuance application and welfare benefit application (as of October 2017)

Public Information Disclosure System

This system provides information held and managed by public institutions to citizens in a convenient and prompt manner with the aim of expanding their right to know and enhance transparency in public administration.

System Features

Information disclosure before request

Public institutions disclose in advance, even before requests are made from citizens, the information on policies that are closely related to citizens' daily lives and large-scale budget projects, which citizens are likely to be highly interested in.

- It provides the information title and link for users to conveniently look up the list of information already disclosed on the website of each institution.

Information disclosure in its original form

The system provides the original texts of documents produced in public institutions on a real-time basis, which are classified as information to be disclosed and approved by director-level executives or higher.

One-stop shop service

Once a request is filed, the institution holding the information reviews whether or not to disclose the information, notifies of the decision and provides the requested information.

- The process of search, request and perusal is all offered at a one-stop shop.

Mobile service

There is also a mobile service, through which citizens can request for information without restrictions of time and place and check the results (launched in June 2017).

Site Map

Information already disclosed, original text information, information disclosure request, status(statistics) of information disclosure, user guide, etc.

User

Online Civil Complaint Center (Eungdapso)

This integrated civil petition management system that unifies windows for online petitions and proposals, which had been scattered in different functions and departments, with the aim of improving the efficiency and transparency of services for citizens.

System Features

Unified channel for citizen petitions and requests

- Citizens can file petitions or proposals on all areas and check the results on the same website.
- 3-step notifications of "reception-transfer-result" allow citizens to understand how their petitions or proposals are processed.

Integrated management of petitions and requests

- The system reduces redundant work as it receives and handles multiple petitions and proposals all upon a single website (The amount of time required for handling a petition decreased by 1.0 day, from 3.8 days before the system development to 2.9 days after).
- Petitions or proposals on all areas-civil petitions, opinion proposals, reporting on public official corruption, public interest reporting, human rights violation, and social welfare-can be filed.
- Feedback is sent out on the same day of reception of proposals that are filed as simple requests.
- As for petitions or requests that need in-depth review, the system notifies the petitioners with the estimated processing time and the department in charge before providing the results.
- The whole process of how a petition or proposal is handled is completely open on the system website and SNS.

Eungdapso offline

- Offline *Eungdapso* makes a tour around the city and provides consultations and various administrative services.
- Citizens can have one-on-one consultation with specialists of each area and also have certificates and documents issued.

Emergency messaging through SNS

In case of emergency, the system sends out official messages all at once to registered citizens, informing how to cope with the situations.

Mobile Voting System (mVoting)

This mobile voting system is designed for a fast collection of citizens' opinions regarding the city government administration and their application to policy development.

System Features

Mobile voting system

It is a simple mobile voting system open to anyone who accesses the app or website and goes through the authentication process via telephone or SNS.

Diverse voting types

- **Policy voting** : Polls organized by the Seoul government (city, districts, educational offices) asking for citizens' opinions
- **On-site voting** : Polls accessed by only the participants of certain events such as festivals, conferences, trainings, etc.
- **Employee voting** : Polls organized by the Seoul government asking for the employees' opinions
- **General voting** : Polls organized and voted by citizens

Major voting functions

- **Open voting** : Polls open to all mVoting users
- **Closed voting** : Polls open partially to specific samples sorted by phone number, password, residence, site/location (GPS or QR code)

Site Map

- **Vote** : Participating in policy polls, citizen polls, local polls, etc.
- **Make poll** : Creating a citizen poll with short-answer, multiple-choice, or true-or-false questions
- **My voting** : Checking the participated, created, and obtained polls
- **Policy application** : Checking whether the policy voting results are applied to policy making

User

The system is mainly for Seoul citizens and Seoul Metropolitan Government, but is open to all citizens and institutions.

Estimated Development Period

12 months

Estimated Development Cost

USD 0.2 million

Award/ Recognition and Export

- Grand Prize in App Award Korea 2014 in the category of public service (Digital Chosun, 04, 2014)
- Selected as a Gov3.0 lead project, received government commendation (12, 2014)

Mobile Civil Complaint Report System

This system allows citizens to report complaints or grievances (parking violations, illegal ads, urban facilities, wastes, and pavement conditions) they may have in all aspects of the city, including facilities, transportation, and environment, via their smartphones or the website on a real-time basis and promptly be informed on the whole process of how such reports are being handled and settled.

System Features

Location-based and photo reporting

Using the website or mobile application, citizens can mark the problematic spot on the map and upload photos when necessary.

Complaint or petition processing

Once a complaint is filed through the system, it is relayed immediately to the "120 Dasan Call Center," which locates the case into the relevant department using the integrated civil petition/proposal management system. Each relevant department delivers the result to the citizen who filed the complaint.

One-Stop Civil Service Portal (Government24)

This government portal provides a single window to all government services and policies of central government ministries, public institutions and local governments 24/7. Users can also view, apply for and receive information and certificates on the portal.

System Features

Government service search

The system collects information on 70,000 government services, provides the information by each area, and allows users to search for government services by life cycle and customized benefits.

Service for citizens

Based on the interconnection with government and public services of other institutions, the system offers information on 5,000 types of services, of which 3,000 types can be applied for online.

Information

The system provides government news, policy information, research reports, legal information and statistics, which are often needed by the citizens.

Mobile service

Major services are also available on mobile for user convenience.

Site Map

Government news, civil petition application and result, document authenticity verification, civil petition document issuance record, status of civil petition document issuance, life information, and benefit finder

e-Government enhancing efficiency of public administration

Public Administration

The key enabler of e-Government development in Korea is an the infrastructure that covers the entire central and local governments. In Korea, all central government ministries and local government offices share information by interconnecting their systems for document and HR managements. Any duplicated systems are integrated and more administrative information is shared in order to improve the expertise and efficiency of public administration.

Public Administration

- 30 National Human Resource Database 31 Digital Mayor's Office

Government Integrated Data Center (GIDC)

This data center exclusively built for government use, leads the digital government and provides quality ICT services based on the e-Government foundation, which is firmly-built through the innovation of information resource management.

System Features

Integrated operation of e-Government systems

The data center integrates the management of e-Government systems of 45 central administrative organizations and has built for the operation of a comprehensive AI-based, multi-layer defense framework.

Construction and operation of K-Net

The data center operates K-Net, the exclusive government communications network that is fast and stable.

Resource integration and cloud service

- The data center makes group purchases and installation of IT resources needed in government and public institutions.
- Works of 740 central administrative organizations are moved to cloud.

Common big data platform ('Insight')

The center builds and operates a common big data platform for central government ministries and local governments to share.

Site Map

Internal Use (Integrated Data Center for Government)

Government Enterprise Architecture

This system allows integrated registration and management of information resources (information systems, data and hardware) and EA information of the public sector. It offers a reference model for promoting informatization and also provides and manages information based on the government-wide EA, so it can be shared in informatization efforts.

System Features

Information resource registration and maturity/status survey

- The system allows each individual institution to register, and manage EA information and use the function of EAMS (EA management system).
- It provides functions for EA maturity measurement and EA status surveys.

Prior consultation to prevent redundancy

The system enables prior consultation on redundancy, interconnection/ shared use analysis, etc., in order to prevent duplicated investment to IT projects by different administrative organizations.

Performance management

The system provides measuring and managing functions on the operational performance of e-Government systems to support the integrated performance management of e-Government projects.

EAMS support for each institution

This system provides EAMS function to institutions having difficulties building and operating their own EAMS.

e-Government Standard Framework

This system develops open-source, standardized software frameworks, and standardizes the functions commonly used in government systems. It is a free system open to all, which further prevents technological dependency on particular vendors and expands opportunities for SMEs to take part in national ICT projects.

System Features

Open-source framework

- The system is open-source, preventing dependency on particular technologies or vendors.
- It actively uses new global technologies to cope with the fast-changing environment.

Use of national standard technologies to improve efficiency of public informatization

- Reusing public resources saves cost.
- It enhances the quality and interoperability of public systems.

Foundation-building for domestic software industry development and fair competition

- The system can be actively used by SMEs to improve their competitiveness.
- It can be also used for commercial solution development for free of charge.

Administration Information System for Local Governments (Saeol)

This is a comprehensive administrative information systems designed to help local public officials to handle public services and administrative affairs online, as they are delegated by the state government.

System Features

Administrative support

- The system provides administrative support for 22 types of business handled by local governments, such as licensing/permission.
- It provides mobile administrative services, enabling access from the field.

Civil petitions, requests and applications

- The system provides convenient and fast one-stop shop services for citizens, including services for inheritance and childbirth.
- It enables automatic issuance of civil petition documents, and O2O (online-to-offline) service available everywhere.

Information hub

- The system interconnects administrative information of central government ministries, local governments and public institutions.
- It also discloses administrative information for citizens, including spatial information and license/permit data.

Site Map

- Metropolitan/provincial administrative information system : 22 types of business including local autonomy, welfare/women, common properties, public health and sanitation, etc.
- Local administrative information system (Saeol) : 22 types of business including public service management, civil defense, local industry, road traffic, etc.

Resident Registration System

This system records and manages resident registration information of people living in Korea; information is used in administrative tasks including welfare, education and election to include and provide customized services for all residents.

Development History of Resident Registry

Introduction : Registration record cards in paper form (1962~1975)

- The Resident Registration Act was established (1962) to clearly ascertain the population movement. The Act required the government to allocate 12-digit registration numbers to residents and issue certificates (1968).
- The resident registration numbering scheme changed to consist of 13 digits (1975).

•Social/economic/technological background

1962 26.28M population; GDP/capita USD 90; 3.8% economic growth rate

1967 The first computer in Korea introduced for demographics and other administrative affairs.

1975 35.28M population; GDP/capita USD 615; 7.9% economic growth rate; establishment of the Master Plan for Computerization of Administrative Affairs (1,029 computers introduced in Korea)

Computerization : Registration record cards replaced with information system (1987~1994)

- The resident registration computer network was established (1987~1991).
 - 3,600 town offices, local government offices, central government ministries, and public institutions were all connected online.
- 78 categories of resident registration information, including name, address and military service record, were organized into a database (1989).
- Town offices started computerized handling of resident registration work (1991).
- Certified copies or abstracts of resident registration were issued via online (1994).

•Social/economic/technological background

1987 41.62M population; GDP/capita USD 3,267; 12.5% economic growth rate

1987~1991 National Backbone Network Project implementation, including the National Administration Network (computerization of resident registration)

1994 44.64M population; GDP/capita USD 10,168; 9.2% economic growth rate

Ubiquitous : Issuance of resident registration certificates and abstracts via kiosks(2001) and website(Gov24)

- Public Information Sharing Center (2002~2006): Government and administrative information sharing contributed to simplified procedures for handling civil petitions and service applications.

•Social/economic/technological background

2001 47.37M population; GDP/capita USD 11,177; 4.5% economic growth rate; (1995~2010) Korea Information Infrastructure (high-speed information network) project

2004 48.08M population; GDP/capita USD 15,884; 4.9% economic growth rate

2016 51.25M population; GDP/capita 27,533; 2.8% economic growth rate

Resident Registration System

System composition

- Hardware : 53 pieces including web servers, database servers, memory units and security equipment
- Software : 14,546FP in 7 areas including the operation software for the central resident registration information system, and 7 sets of commercial software including database encryption software
- Database : 73.34M resident registration data (51.77M for individuals; 21.57M for households)
- Network : The government information network (KII-G) connects town offices ↔ local governments ↔ central resident registration system ↔ disaster recovery system for resident registration information ↔ ministries and public institutions.

System operation

- The system manages registration information of all citizens to ensure universal provision of administrative services.
- Local resident registration information system : This system allows some 3,500 town offices to handle registration number allocation and move-in reports.
- Central resident registration information system : This system interconnects and manages nation-wide resident registration information and issues resident registration certificates.

System utilization

- A wide variety of civil affairs regarding resident registration, such as certificate/abstract issuance, are handled through kiosks or the Internet (Gov24) anytime, from anywhere.
 - Online services : 21 services offered by 53 institutions-126.6 million cases of service applications/requests handled in 2016
- The system provides educational and welfare services that can be used for handling various administrative affairs like tax and election, as well as school enrollment and health insurance, which are customized to the life cycle of individual citizens.
 - Online interconnection : Regularly providing resident registration data for 70 business types of 35 institutions; 1.58 million cases of data provision in 2016
 - Offline interconnection : Providing data to 72 institutions when needed; 718 million cases of data provision in 2016

Government Public Key Infrastructure System

This is a government-level authentication system that ensures the identification of administrative institutions and public officials exchanging digital documents, prevents digital document forgery, and promotes safe distribution of digital documents.

System Features

Support for digital signature certificate management

The system verifies identities of public officials, issues and operates certificates for individuals for handling administrative affairs.

WebTrust standard compliance

The system is the first certification system in Korea that obtained the global trust mark, WebTrust certification, for CA (Certificate Authority) and SSL (Secure Sockets Layer) in October 2015, further adding to the reliability of system operation.

Site Map

- Administrative digital signature certificate issuance, renewal, disposal and verification services
Management of certificates for individuals and institutions (for official digital seal, servers, G-SSL, etc.)
- Storage and recovery services for digital signature encryption key

Enterprise Portal for Administrative Affairs (Hamoni)

This is a portal system for internal administrative affairs of the staff of the Ministry of the Interior and Safety

System Features

Interconnection to in-house systems

The system is interconnected to other in-house systems such as e-approval, e-mail and e-HR (*e-Saram*) systems to support a broad range of administrative affairs.

Search and document security service

The system provides document and e-bulletin search service and ensures secure document management with its security system applied to important documents.

Management of National Assembly documents, policies and integrity

- The system efficiently manages documents requested annually by the National Assembly.
- It performs streamlined management of ministerial governance affairs and policies and also operates a system for corruption reporting to improve the integrity of officials.

Mobile Hamoni service

Some features are also available on mobile – press release, conference room reservation, and notifications.

Site Map

Search, document security, executive presence/absence signal, National Assembly document management, integrity management service, library, executive schedule management, Ministry schedule management, online poll, bulletins, etc.

On-nara Knowledge Management System

This system is shared throughout government ministries, through which public officials share and use a broad area of knowledge and resources, including documents and videos produced by different ministries, as well as communicate with each other through shared mailing, scheduling, and board functions.

System Features

Open system

On-nara's subsystem, GKMC (Government Knowledge Management Center) was converted into an open format for the knowledge information to be used in individual business portals or systems.

- Materials such as government plans, white papers, manuals and guidelines are systematically collected and shared.
- The system interworks with other systems holding major information for integrated search and use of knowledge information.
- The system allows opening up online communities, which serve as communication channels among public officials of different organizations.

Mailing among nation-wide public officials

The On-nara mailing system enables mail transactions among all central and local government officials throughout the country.

- The mailing function will be offered through the mobile mail app, allowing officials to check their mails even on business trips (service to be launched in early 2018).

Site Map

Mail, schedule, board, knowledge, work manual, community, etc.

Electronic Human Resources Management System (e-Saram)

This is a standard HR management system that supports HR management of ministries and HR policy-making decisions of the Ministry of Personnel Management (MPM), by computerizing the entire personnel administration, ranging from appointment to retirement of public officials, in all administrative institutions.

System Features

Standard HR affairs management for each ministry

The system helps the electronic processing of HR affairs of each ministry, regarding personnel management, remuneration, and service (leave, overtime, business trip, travel expense calculation, etc.)

Decision-making support for HR policies

The system supports decision-making of HR policies, such as management of senior executives, HR screening and government personnel appointment of MPM, by using the data and statistics of the standard personnel management system.

Personalized service for public officials and administrative manpower

The system allows public officials and administrative workers to check their HR score cards, apply for education/training, leave and business trips, and check monthly salaries.

e-Saram mobile service

Personalized services are also provided on mobile.

Site Map

National Human Resource Database

This human resource information management system collects and manages information on public official candidates, in order for government offices to appoint and employ qualified persons for key positions.

System Features

Registration and management of HR information

- The system offers functions of registration and management of HR information (career experiences, educational background, news articles, and multimedia data).
- Such registration and information updates are done by the candidates themselves through access to the website or by data interconnection of related systems.

Search, inquiry and recommendation

- The system offers search and inquiry functions, including natural language search, on a large pool of human resources.
- It also enables recommendation management for talent recommendations for various positions of the government.

Citizen recommendation

The system enables the citizens to participate in further developing the national talent pool by recommending new and competent human resources.

Digital Mayor's Office

This system integrates and visualizes, on a real-time basis, 10 million pieces of data in 167 systems (on open data, transport operations and information and integrated safety management) handled by the Seoul Metropolitan Government, as well as the information of 800 CCTVs installed in critical areas out of some 4,000 CCTVs in Seoul.

System Features

Policy support through integration and visualization of major governance data

The system integrates, structuralizes and visualizes the governance data dispersed in different departments so the policy-maker (mayor) can make scientific and reasonable decisions based on data.

Provision of real-time information and data

The system allows real-time monitoring of information on all disasters, accidents, safety and traffic situations in Seoul on a large interactive screen, and the mayor can give real-time orders to workers in the field through voice or video telecommunication.

Prompt sharing of governance affairs with the citizens

From December 2017, information on key policies and projects will be shared with the citizens real time, which will enhance the responsibility and transparency of the city government administration.

Site Map

- Information on city safety (fire, disaster, and accident), air and water quality, and prices
- Real-time public opinions (through civil petitions and government news)
- Project list and details of the Seoul Metropolitan Government
- Voice and video call to relevant fire or police stations in case of disaster or emergency

e-Government ensuring public safety
and order

Judicial Affairs / Public Order

Maintaining the social security and Public Order is an important duty of a government. In order to realize such values, the Korean government is handling business processes ranging from legal information guides to case filing and proceeding all through the e-Government systems. The online provision of these services contributes to better efficiency and fairness of criminal and judicial affairs.

Korea Information System of Criminal Justice Services (KICS)

This system is a portal for citizens offering comprehensive criminal justice information, including information on court trials and investigations of the Ministry of Justice, Prosecutors' Offices, National Police Agency, and Korea Coast Guard, through the Internet and mobile.

System Features

Shared use of computerized information among criminal justice agencies

The system interconnects criminal justice information of the National Police Agency, Prosecutors' Offices, courts and the Ministry of Justice to provide a wide range of services.

Progress check on criminal cases

Users are able check the progress of their criminal cases 24/7 on the portal without having to visit relevant offices.

Paperless case handling

The system offers electronic summary proceedings for some of the cases including unlicensed or drunk driving and ensures fully electronic handling of such proceedings.

Constitutional e-Court System

This system enables users to file constitutional adjudication requests, obtain documents and view e-records via PC or smartphone anytime, from anywhere.

The system also establishes an e-court environment, which allows the use of multimedia equipment such as cameras and large-screen monitors, for e-records and precedents search activities in the courtroom and provides real-time videos through the course of a trial.

System Features

Electronic processing of constitutional adjudication

- The system allows the online/electronic submission of documents for constitutional adjudication requests.
- Constitutional adjudication documents are viewed on the website (e-delivery).
- Case information and e-files collected throughout the entire process of adjudication are registered into the system for electronic management.

Establishment of the e-court environment

- Electronic equipment, such as cameras and large-screen monitors, are introduced in courtrooms.
- Courtrooms undergo renovation to accommodate electronic features.
- The e-court operation system provides functions of record retrieval and video service.

Data center and other infrastructure building activities

Site Map

Automated Immigration Clearance System (SES)

This cutting-edge immigration system uses the automatic immigration clearance system of Korea, called Smart Entry Service (SES), which allows travelers to register their passport and biometric information (fingerprints and facial images) in advance and handle the immigration process by themselves at the Smart Entry Service auto-gates.

System Features

Non face-to-face immigration clearance

The system ensures simplified immigration procedures, where travelers can use automated equipment for identification and quickly finish the immigration process without facing immigration inspectors.

International sharing

The system is shared with other countries operating automated immigration clearance systems: in particular, cooperation for its shared use is increasing with the United States, Hong Kong and Macau.

Immigration Information System

This is a comprehensive immigration administration system that provides a wide range of services and information, from immigration inspection and control over foreigners' stays to border management and life information for foreigners.

System Features

Immigration inspection using biometric information (ICRM)

The system detects foreigner identity mismatches using biometric information such as fingerprints and facial images.

Fast immigration clearance through auto-gates (SES)

The system completes the immigration clearance of each Korean national in an average 15 seconds on average, without face-to-face inspection.

Safe border management through passenger verification in advance (i-PreChecking)

The system receives and analyzes passenger information in advance, notifies airlines of whether the passengers are entitled to have boarding passes issued, and blocks the boarding of passengers liable to committing crimes in advance.

Foreigners' stay management and provision of life information (Visa Portal and Hi Korea)

- Korea Visa Portal handles visa applications and issuances for foreigners.
- Hi Korea is a portal that offers life information for foreigners.

National Law Information System

This system provides services where citizens can conveniently search and find various legal information about Korea, including acts, treaties, administrative regulations of central government ministries, ordinances and regulations of local governments, precedents, Constitutional Court decisions, and legal interpretations, all at one place.

System Features

Legal information search service

The system offers search service on more than 3.7 million statutes- acts, treaties, administrative regulations and ordinances, Constitutional Court decisions and interpretations.

Information sharing

The system enables information sharing on an open API so that all citizens can use diverse information offered by the center.

Mobile service

The system provides search service on mobile for anyone to check legal information from anywhere.

Integrated Service for Emergency Hotlines

This system receives citizens' accident or crime reports through calls to 112. It promptly dispatches the police (local police officers or detectives) to the scenes for necessary actions and situation control.

System Features

112 report→dispatch→completion all processed at once

(Reception) Reports are received through wired/wireless phone calls, text messages, video calls or videos (Call-back system operated for abandoned calls).

(Directive) Reports are directed to relevant police or departments for immediate dispatch.

Real-time monitoring of patrol car status and dispatch on the digital map

The instant dispatch system (IDS) is operated for finding jurisdiction, patrol car location, and case information on the digital map.

Use of mobile devices, improved efficiency

- "112 reporting system for mobile devices and patrol cars" is developed and used.
- The navigation function helps police officers to immediately locate the scenes and dispatch.

Emergency reporting through 112 Emergency App

- Emergency text/voice call reporting can be made from all smartphones.
- Reporter information (photo and address) registered in the App helps the automatic display of the information and automatic location tracking.

Site Map

- 112 system : 112 situation center status, reception status, directive/completed directive, supervision, callback, multi-media report reception, PolMap (map), case search, standard questionnaire
- 112 system for mobile : Call reception/processing, map, board, etc.

National Forensic Information System (NFIS)

This system receives evidences for interpretation and analysis, and writes and sends out analysis reports on criminal and accident investigations based on the request of national institutions or local governments.

System Features

Transparent analysis

The system writes analysis reports after receiving requests and evidences and ensures transparent analysis through internal approval process and authenticity verification.

Interconnection with external systems

The system supports a fast and accurate analysis process through the interconnection with the government-wide business process management system called On-nara BPS and other information systems for forensic investigations.

Analysis information search

The system provides a search function for analysis request information and reports as well as analysis statistics for service users' convenience.

Probation Information System

This is a support system for probation duties, which manages the attendance of persons on probation who are obliged to provide community service, undergo education or other impositions for efficient management of execution.

The system also manages written investigations as requested by courts, Prosecutor's Offices, juvenile correctional institutes and prisons.

System Features

Execution management

The system performs execution management and attendance check regarding community service, education and impositions of persons on probation.

Remote attendance check

When executing orders of public service and education in cooperating institutions, the system allows the Cyber Probation Office to take a photo of each person on probation, and sends the photo to officers for remote attendance check and execution control.

Certificate service

Upon request of the persons on probation who had completed duties of community service, education and other impositions, the system issues relevant certificates, such as the certificate of community service.

Cyber Probation Office

This probation business system takes photos and remotely checks the attendance of persons on probation, who are obliged to provide community service and undergo education to prevent recommitting of the crimes and follow such orders in cooperating institutions. It also performs remote management of progress reports written by members of "Beopsarang", a private voluntary organization that cooperates with the Ministry of Justice.

System Features

Remote execution service

The system helps cooperating institutions to take photos of persons on probation who are obliged to provide community service or undergo education, and notifies local probation offices on their attendance and execution.

Remote probation service

- Members of "Beopsarang", a private group of volunteers who provide counseling, job opportunities and financial assistance to criminals including those on probation, interview juveniles on probation, write reports (progress reports) and remotely register the information into the system.
- Probation officers review the progress reports received in the system and use them for guidance and surveillance.

Sex Offender Alarm System

This system allows a real-time search on the presence and personal information (photo included) of sex offenders in specific areas or in the vicinity of users' home or workplace through the website or mobile application.

System Features

Real-time provision of personal information of sex offenders

Personal information of sex offenders is provided real time in 8 categories—name, age, photo, registered address and living address, physical information, crime summary, sexual criminal history, and electronic monitoring.

Sex offenders' personal information search

- **Map-based search** : A click on the map provides sex offender information in the area.
- **Condition search** : Keyword search provides sex offender information that meets the search condition.
- **Mobile** : Voice and text information on the presence of sex offenders around the user's location is delivered through smartphone, even on the move, based on time settings (every hour, 12 hours and 24 hours).

Sexual crime prevention and safety information

The system provides information on various policies and guidelines, including emergency measures in sexual crimes, guardians' action guide, victim protection and support schemes, and victim support facilities.

e-Government creating values with spatial information

Land / Transport / Ocean

The geospatial information is influential to all areas of the politics, public administration and education, and therefore must be managed at the national level. Korea has established the infrastructure for national spatial information to utilize for land development and transport planning and provided the information open for all citizens to easily access. Such spatial information serves as a foothold for achieving the “smart nation” in the age of the Fourth Industrial Revolution.

Land / Transport / Ocean

Architectural Administration System (Sae-um-teo)

This is a national standard system for Internet-based easy and convenient processing of affairs regarding architectural and housing administration and services in Korea (covering authorization/ permit → commencement of construction → sale → completion of construction (approval for use) → demolishing).

System Features

No visit, no paper

This system saves approximately USD 930 million each year from 100% electronic handling of business process without requiring visits to administrative offices.

Non-stop flow of administration

The system ensures business continuity and efficiency in terms of architectural and housing administrative procedures.

Government policy-making and building lifecycle management information

- Real-time architectural and housing information and statistics are used in government policy-making.
- The system promotes informatization of building lifecycle management, from planning→construction→management→demolition.

Site Map

- Application and processing of administrative services for architecture (permit, commencement of construction and approval for use)
- Application and processing of administrative services for houses (permit, commencement of construction and approval for use)

Korea Land Information System (KLIS)

This is a foundation system for real estate administration of the Ministry of Land, Transport and Infrastructure, 17 provincial and metropolitan governments, and 228 local governments. It handles land administrative affairs, provides real-time information on land administration to outside institutions, and provides services for citizens through the Internet.

System Features

Business management for land administration

The system produces and manages information on 5 areas of land administration-licensed real estate agents, real estate development business, development charge, land transaction, and real estate brokerage.

Service for citizens

The system provides 28 types of online application services regarding real estate affairs like brokerage business registration and change or license re-issuance, as well as a search service for information on real estate brokerage and development businesses.

Spatial information use

The system deploys property and spatial information, owned by the National Spatial Data Infrastructure Center, to support land administrative affairs in government ministries.

Site Map

- Licensed real estate agents : Registration of successful examinees in qualifying examination and license issuance
- Real estate development business : Management of real estate development businesses, business records and experts; management of cost raised by land price increase caused by land development (development charge)
- Land transaction permit : Seller/buyer management, permit issuance
- Real estate brokerage business : Management of brokerage businesses, agents, employees; registration certificate issuance

National Real Estate Information System

This system integrates individually-operated real estate information systems and connects to cadastral and real estate information of local governments in order to produce and share policy and statistical information for administrative and policy affairs in the central and local governments and public institutions.

System Features

Original real estate information

The system collects and renews original real estate information of local governments nationwide and provides search and viewing service.

Service for citizens

The system provides services like “Find my ancestors’ land” and “Find my land” for citizens.

Statistics on real estate policies

The system produces statistics on real estate policies, including statistics on land/ house/ mountain ownership through monthly/ quarterly/ semi-annual/ annual DW/DM.

Administrative support

The system provides support for administrative affairs regarding real estate registration numbers of associations and foundations, other than corporations, 11 surveying businesses (surveyor, equipment, engineers, etc.), and management of the old land cadaster.

Mobile service

The system operates a mobile application called Smart Land Information, which allows real estate information search on mobile devices.

Korea National Spatial Data Information Portal

This system is a hub of spatial information that interconnects, shares and integrates national spatial data in order to prevent redundant development of spatial information in each institution or for each business and to solve the issue of data discordance.

System Features

Integration of national spatial information (data collection and provision)

The system collects and integrates national spatial data produced by central government ministries, public institutions and local governments to provide to users (64 information systems of 28 institutions are interconnected).

Quality management of national spatial information

The system reviews the quality of national spatial information in terms of recency, schema, and metadata-space consistency.

Spatial information search and analysis

The system provides functions of spatial information search and analysis based on the information service framework, map presentation using map (spatial information), and analysis and comparison of land policies and images needed for aerial image-based decision making.

General Information Center on Maritime Safety and Security (GICOMS)

This system collects information on marine safety, piracy, and operation data of Korean ships based on the ship location and provides the information to government institutions or industry workers for use in preventing marine accidents and improving the salvage system.

System Features

Vessel Monitoring System (VMS)

The system receives ship operation data sent out from the automatic identification system (AIS) or long range identification and tracking (LRIT) system installed in ships; and displays the information on the electronic navigation chart.

Ship Security Alert System (SSAS)

Using satellite signal, the system receives alerts sent from ships having pirate, terrorist or other security attacks and spreads the information to relevant institutions.

Integrated database on ship information

The system enables a one-stop search on ship registration, inspection, and business data through integration of information from individual systems.

Site Map

Marine safety information, navigational warning, marine weather information, typhoon information, piracy information, search and management of marine accident information

User

Access to ship operation information and the security alert system is only for national institutions performing relevant duties. Other marine safety information is available for ship business operators and industry workers.

Transport Advice on Going Anywhere (TAGO)

This system provides safe and convenient public transport information to citizens by integrating nation-wide public transport information, such as express/inter-city/intra-city/town bus, air, rail, marine and subway.

System Features

Collection and provision of integrated public transport information

The system collects information on public transport such as bus, air, marine and rail and provides the information to the general public through an open API.

Public transport information guide

The system provides information on related websites as guidance on how to use diverse means of public transport.

Provision of technical and legal information

The system provides information on related technical standards, laws and regulations, and methods of interconnection.

Traffic Monitoring System (TMS)

This system analyzes the traffic volume on national expressways, national highways, state-funded local highways and general local highways to provide basic data required for road traffic administration, including road planning, construction and maintenance, and for research and studies.

System Features

Data collection

The system collects data from the equipment installed on roads to collect traffic information.

Traffic data analysis and provision

- The system provides statistical analysis on the current status of nationwide traffic condition, by each road type, and permanent traffic volume.
- It offers statistics on traffic volume of each road type.

E-map search service

For the sake of web user convenience, the system supports yearly traffic information search and download of selected areas on the e-map.

E-book service

The system provides the e-book version of Annual Traffic Volume Reports.

Site Map

Traffic volume statistics and analysis, traffic information search and download using e-map, and e-book versions of Annual Traffic Volume Reports

Seoul Transport Operation Information Service (Seoul TOPIS)

This cutting-edge traffic information system integrates and manages transport information (traffic flow and unexpected incidents) of the megacity Seoul with 10 million population, provides and analyzes a wide range of transport information, and facilitates citizens' travel convenience and policy-making.

System Features

Integrated transport management

The system takes control of real-time traffic conditions and unexpected incidents and provides information on traffic flow, public transportation, road CCTV images and parking via web, mobile and VMS.

Bus operation information

The system manages the operation data of about 9,000 buses using real-time GPS, monitors the allocation interval, non-stop operation and sudden acceleration/deceleration, and provides bus arrival time and subway information on web, mobile and BIT.

Automated control

The system regulates illegal parking and bus-only lane violations through CCTV cameras and automatically imposes fines.

Big data analysis

The system uses big data on the 5-year accumulated traffic data to offer traffic forecast service, and uses information on transport cards and public transport operation to support scientific development of transport policies.

Site Map

Information on traffic flow, public transport (bus/subway), parking, unexpected incidents like traffic accidents/events/rallies, car-sharing, bicycles, pedestrian accidents, and traffic forecast service

User

Citizens, public officials of government ministries and Seoul government, private businesses, etc.

Passport Information Comprehensive Administration System (PICAS)

This is an information system that handles the entire process of electronic (biometric) passport issuance online and operates 24/7 in Korea and abroad.

System Features

Simple application process using ICT

The system replaces certificate document submission with real-time data sharing among ministries, enabling the retrieval of resident registration information of the Ministry of the Interior and Safety; identity information of the National Police Agency; and military service information of the Military Manpower Administration.

Issuance of passports meeting international standards

The system reinforces the identification process with a real-time electronic identification function and digital photos taken by overseas diplomatic offices to meet the passport standards as defined by ICAO.

Combination of centralized and decentralized methods

Korea Minting, Security Printing and ID Card Operating Corporation (KOMSCO) takes charge as the only passport manufacturer in Korea to secure quality consistency; 248 local governments and 175 embassies and consulates overseas receive applications and issue passports to enhance accessibility and convenience of citizens.

Diverse utilization of collected passport information

Passport information is also provided to other institutions for use in immigration in the Ministry of Justice, lost passport identification in Interpol, passport information verification in Gov24, and emergency contact of Korean nationals residing abroad.

Site Map

All procedures related to passport management – passport issuance application and examination, payment receipt and revenue management, issuance and reading, delivery and distribution, certificate issuance, inventory management of blank passports and consumables, change of stated information, and statistics

Driver's License Information System

This system provides administrative service on license acquisition and management and other online services for convenience of the citizens

System Features

Management of driver's license

- The system provides administrative service on the entire process of obtaining a driver's license.
- It offers driver's license renewal and issuance service based on system interconnection with the National Police Agency.

Paperless service for citizens

The system enables paperless service for citizens through the interconnection to public information and services of other organizations.

Online service

- The system provides information on the process of driver's license application, examination videos and notice.
- It offers 10 major services for user convenience, including reservations for exam applications.

Site Map

Application for driver's license examination, student license issuance, application for driver's license issuance, driver's license information search, examination information, and service for citizens

e-Government enhancing financial transparency

Finance / Statistics

The Growth of the national economy requires change and innovation in financial management. Korea has built a computing system for financial and statistics management, which helps successful financial planning and the effective execution of the plans. The entire process of tax payment, budget execution, national property management and statistics is operated upon e-Government systems, thus enhancing transparency and efficiency of work as well as gaining trust of the citizens.

Finance / Statistics

- 60 Electronic National Tax System (HomeTax)
- 61 Digital Budget and Accounting System (dBrain)
- 62 Korean Statistical Information Service (KOSIS)
- 63 Nara Statistics System 64 National Property Inspection System
- 65 Korea Property Information System (*e-Narajaesan*)
- 66 Local Government Financial Management System (*e-Hojo*)
- 67 Local Tax Affairs Information System of Seoul Metropolitan Government
- 68 Deposit Insurance Payout System
- 69 Online Bidding System (Onbid) 70 Credit Recovery Information System (OnCredit)
- 71 All Public Organization Information In-One (ALIO)

Electronic National Tax System (HomeTax)

This system provides an integrated tax administration service, which allows taxpayers to file and pay taxes and view or receive e-tax invoices and certificates through the Internet from their home or office without having to visit the tax office.

System Features

Tax filing and payment service

- The system enables preparation and submission of various tax returns on PC instead of paper.
- Taxpayers can use the system to pay their taxes without having to visit banks or tax offices.

Search and issuance service

The system provides services regarding tax return and payment, production of materials for assessment, management of e-tax invoices, and document search/issuance.

Certificate issuance service

Users do not need to visit tax offices but can request certificate issuance via the Internet and print out the documents from their PCs.

Document request and submission

The system enables request for or submission of documents, which are administered by the National Tax Service, through the Internet.

Site Map

Search/issuance, document certificates, request/submission, return/payment, consultation/report, etc.

User

Citizens, sole proprietorships, corporations, and tax agents

Award/ Recognition and Export

Awards

- World's first tax agency to receive ISO/IEC 20000 certification (2008)
- Best Practice in Electronic Tax Administration by OECD (2006)

Exports

- Exported to Sri Lanka (2010), Mongolia (2011)
- 2012 : 24 visits to 40 countries-US, Thailand and 11 CIS countries including Uzbekistan, and more.
- 2013 : 15 visits to 17 countries-including Vietnam, Ecuador, Russia, and India
- 2014 : 13 visits to 11 countries-including Germany, China, and Saudi Arabia
- 2015 : 12 visits to 9 countries-including Algeria, Ecuador, China, US, and Uganda
- 2016 (As of June) : 5 visits to 5 countries-Japan, China, Nigeria, Iran, and Georgia

Digital Budget and Accounting System (dBrain)

This is a performance-oriented financial management information system (FMIS) that applies the concept of management and competition to the entire process of financial activities, including budget formulation/ execution, accounting, settlement, and performance management. This is a FMIS model recommended by the World Bank.

System Features

Performance-oriented, strategic financial operation framework

The system represents a financial system innovation, where financial resources are strategically allocated and operated for performance.

Real-time business link and flow focused on project management

This system displays all financial information produced through the process of financial affairs and allows real-time monitoring of procedures within the authority of the project manager.

Real-time financial management

All affairs regarding financial income and expenditure are digitized and processed real-time through electronic bill presentment and payment (EBPP) and electronic funds transfer (EFT) technologies.

Provision of analysis information of financial statistics

The system provides a wide range of accurate statistical analysis information by conducting analysis from different perspectives, such as by area, ministry and function.

Site Map

Korean Statistical Information Service (KOSIS)

This is a one-stop statistical information portal system that integrates all official statistics produced in Korea for users to search the data they want all at once.

System Features

KOSIS statistical database

The system provides official statistics of Korea, including domestic/ regional/ international/ and North Korean statistics.

Visualized statistical contents

The system provides visualized statistical contents for users to easily understand information.

Information sharing (open API)

The system offers a standardized API to allow the statistical information to be used for web or mobile app development.

Mobile service

Services like domestic/ international statistical indicators, "Where I Stand in Statistics," "Men and Women", and web cartoons (webtoons) on statistics are provided on mobile.

Site Map

Domestic statistics, regional statistics, international and North Korean statistics, online publications, webtoon on statistics, UCC, RSS, Open API, integrated search, etc.

Nara Statistics System

This is a general-purpose, shared statistical information system that standardizes and streamlines the entire process of statistics preparation, from planning to production, service and data storage.

System Features

KSBPM-based statistics production system

This is a general-purpose statistics production system built upon statistics metadata, which applies the concept of standard process for management and production of national statistics.

* KSBPM: Korea Statistical Business Process Model

Easy and convenient designing of survey forms

This system offers a designing tool, which helps users to make different types of survey forms using templates provided.

Input review and aggregation to improve statistics quality

The system allows users to register rules defined to extract data input errors, and design different forms of statistical tables by themselves.

Diverse survey methods

Diverse survey methods, including CADI, CAPI, CASI, CATI and mCASI are available.

PC-based statistics production system (NARA Pro)

Anyone with a PC can enjoy a broad variety of functions—survey form designing, data collection, data review and analysis—for statistical surveys.

National Property Inspection System

This is an electronic system for a business process regarding management and inspection of national properties, such as national property confirmation and checkup and measures to preserve rights of ownerless real estate.

System Features

Paralleled operation with a mobile system for field inspection

- A mobile-based system for national property field inspection is established to enhance work efficiency.
- The system constantly examines the measures following national property confirmation and checkup and their implementation.

Developing a database of inspection results

The system builds a database of the results of national property inspection and the current status of unused administrative property ownership so the information can be used for systematic management.

Provision of aerial photo service

The system integrates the aerial photos provided by private sector businesses and the cadastral map provided by the Ministry of Land, Infrastructure and Transport to identify ownerless real estate and preserve relevant rights.

Site Map

Map, national property register, central government agency designation, e-registration entrustment, consultation on gratuitous reversion, consultation of urban management plan, inspection on management conditions, preservation of rights, state-owned buildings, and notice

Korea Property Information System (e-Narajaesan)

This system integrates national property information for oversight and efficient management of the properties by delegated or entrusted organizations. It also provides services for citizens regarding national property information.

System Features

Business management system

The system integrates 7-step procedures of a national property management lifecycle (planning→acquisition→conversion→operation→development→disposal→settlement).

GIS system

The system achieves immersive geospatial information on widespread national properties including thematic maps on land and buildings, statistical maps and current property information by region to identify usable properties and support decision-making.

Statistical analysis system

The system offers extraction of various structured and user-customized/non-structured statistics, which can be used as the basic data when making national property management policies.

National property portal

The portal satisfies people's right to know by providing national property information to the public, and establishes the foundation for interactive communication with the citizens through features like citizen proposal reception.

Local Government Financial Management System (e-Hojo)

This system manages the whole process of local government financial affairs from financial planning to budget compilation, execution and settlement in an integrated manner.

System Features

Standardization of financial business process

The system standardizes the overall financial management activities of local governments, which had built and operated systems separately before, to improve work efficiency and save costs.

System integration

The system integrates financial affairs between central and local governments and between provincial government and city/town offices based on its connection to local tax and non-tax revenue management systems, in order to improve work speed and accuracy.

Enhanced transparency of local finance

The system supports the computerization and monitoring of major projects, contracts, budget execution and unit price information, improving transparency of financial statistics.

Local Tax Affairs Information System of Seoul Metropolitan Government

This system performs efficient management of local tax affairs of Seoul and its 25 districts regarding local tax imposition, payment, and delinquency. It ensures the flexibility and scalability of local tax administration to adjust to the environmental changes.

System Features

Local tax imposition

The system provides functions of imposition management, bill printing, emailing and SMS sending on 11 local tax items including the property tax.

Local tax payment

The system allows for convenient payment of local taxes anywhere, 24/7, using all types of means including banks, Internet, virtual accounts, ARS, smartphone, convenience store, CD/ATM, etc.

Delinquency management of local taxes

As part of managing local tax defaults, the system secures bonds through the attachment of real estate, bank deposits, salaries, and cars.

Certificate issuance

The system issues certificates confirming property tax payment of public official candidates or citizens, proving there is no default record.

Deposit Insurance Payout System

This system supports integrated management of registration and verification of basic insurance payout data, payment of insurance money, and inquiry on unclaimed insurance money when an insolvent financial company undergoes bankruptcy.

System Features

Registration and verification of basic insurance payout data

The system registers and verifies basic data, such as the amount of deposits and loans of a depositor, which is necessary for the calculation of insurance payout.

Automatic calculation of insurance payout

The system performs automated calculation of insurance payout for each depositor.

Inquiry on and payment of insurance money

- Users visit payment agencies (banks) to inquire, request and receive the insurance money.
- Services regarding deposit insurance money inquiry, payment request and reception are provided through the Internet to ensure user convenience.
 - The link to the system's web inquiry service on unclaimed insurance money is provided on the websites of Korea Federation of Banks, Financial Supervisory Service and Gov24.

Online Bidding System (Onbid)

This is an online asset disposal system designed to integrate public sale information of different public institutions and allow them to open bids online. It is a government-authorized information system promoting efficient disposal (sale/ lease) of public properties

System Features

Public sale search and bidding

The system provides bidding notices on sale or lease of national properties and seized assets, for which Korea Asset Management Corporation is entrusted by the government for management and disposal. It also offers information search and e-bidding functions.

Disclosure of government property information

The system provides sale and lease information of public general property items under the management of local governments and state-owned general property items under management of Korea Asset Management Corporation.

Provision of information on public sale

The system provides mailing service on major sale items, Onbid user reviews, columns on real estate and public sale, and legal information.

Mobile service

Users can register, search items, and participate in bids through the mobile app "Smart Onbid".

Site Map

Public sale item search, bid participation, public sale results, e-contract, Onbid user reviews and columns on real estate and public sale, application for education on Onbid use, matching service for items in disuse

e-Government ensuring health and happiness
of the citizens

Health / Welfare

Korea has digitized the work related to health, welfare, pension, and veterans to build closely interlinked welfare networks. The government also analyzes big data on the social security and provides welfare services customized to individual citizens, which helps block the leakage of the welfare budget by reducing blind spots in social welfare management and preventing duplicate or fraudulent benefit payment.

Health / Welfare

- 74 Social Security Information System (SSIS)
- 75 Welfare Information System (*Bokjiro*)
- 76 Civil Petition System on Food and Drug
- 77 Food Safety Information System
- 78 Electronic Medical Record (EMR) Systems of National Hospitals
- 79 Medical Care Information System
- 80 Funeral Service Information System (*e-Haneul*)
- 81 National Pension Information System

Social Security Information System (SSIS)

This is a major social welfare management system of Korea, which performs integrated management of information regarding various social security benefits and their applicants (application, investigation, determination, provision, and management), and supports welfare administration of the central and local governments and public institutions.

System Features

Support for social security affairs in local governments (Haengbok E-eum)

The system integrates and manages all required information on benefits and service beneficiaries for handling social security affairs of local governments.

- It collects 797 types of beneficiaries' income/property data and service records from 61 institutions to provide to local governments.

Support for social security affairs in central government ministries (Government-wide)

The system offers information and business support for integrated management of government-wide social security benefits, service beneficiaries' eligibility information and their benefit records; and information and business support for proper provision and management of social security benefits.

- It supports social security affairs of 22 ministries – Public rental housing program of Ministry of Land, Infrastructure and Transport, national scholarship program of Ministry of Education, allowances for meritorious persons of Ministry of Veterans Affairs, and financially – aided employment project of Ministry of Employment and Labor.

Site Map

- Haengbok E-eum : 112 welfare services including national basic living security and welfare for infants, disabled, and elderly (88 services including the national basic living security provide benefits in cash (KRW 21T as of 2016)).
- Government-wide : Student loan and scholarship aid program, public rental housing, payment of allowances for meritorious persons and prevention of duplicated coverage, welfare service transfer program, guide to welfare information of central and local governments

User

- (Haengbok E-eum) 32,000 officials handling social security or welfare affairs in 226 local governments throughout the country
- (Government-wide) 1,600 officials in charge of welfare programs in 22 central government ministries and 55 public institutions

Welfare Information System (Bokjiro)

This is a major portal that provides welfare information for citizens in an integrated manner so they can find the service they need, apply for the service online, or request for help with their lives (as of 2014 when the system was redeveloped).

System Features

Welfare service information

The system provides information on welfare services of central government ministries (347) and local governments (6,000), based on which it offers lifecycle-based notification services and customized welfare information.

Online application service

Applications for 16 welfare services can be made online—including infant care fees, pre-school fees, child home-care allowances, elementary/middle/high school students' educational expenses, basic pension and disability pension—and there are constantly increasing services available for online application.

Mobile service

Major services are also available on mobile app for improved user convenience.

Welfare policy information and statistics

The system provides information on welfare issues/news, welfare columns, infographics, social security statistics, neighborhood welfare facilities, etc.

Site Map

Welfare service and information search, online service application and handling, application status check, service guide, help request and details, improper benefit payment report and details

Civil Petition System on Food and Drug

This system receives and handles most of the electronic petitions regarding imported food, drug, medical devices and cosmetics, which fall under duties of the Ministry of Food and Drug Safety.

System Features

Electronic petition system

- Users can file online petitions through the civil petition windows for imported food, drug and cosmetics and medical devices and receive notifications on the progress and results.
- The system provides permit information and more.

Administrative portal system

The system supports investigation and inspection duties and establishes a framework for approval and administrative traceability.

Information sharing system

The system allows information sharing across different systems, and also performs the monitoring function.

Site Map

- Application for imported food inspection, drug business permission and item license, medical device business permission and item license
- Information on civil petitions

User

Food Safety Information System

This system achieves ICT-based integration of food safety information, which had been managed separately by each ministry before, for information sharing without barriers and disclosure of the original information to the citizens.

System Features

Food safety information portal (for citizens)

The system allows users to obtain a wide range of food safety information on a single website–product and company information, neighborhood restaurant information, license and permit information, administrative dispositions, information of food on recall or suspension of sale, and unsanitary food reports.

Integrated food administration system

(for public officials of the Ministry of Food and Drug Safety and local governments)

The system is used for handling administrative affairs for food safety in the Ministry of Food and Drug Safety and local governments.

Food information utilization system (public officials of relevant ministries)

The system allows 12 ministries cooperating in food safety management to share the food safety information.

Site Map

Food safety information, dietary life and nutrition information, company and product search, specialized information on food safety, information for food poisoning prevention, civil petitions on food production, and unsanitary food reporting

Electronic Medical Record (EMR) Systems of National Hospitals

These systems store all medical records of national hospitals in an electronic form. There are 5 systems dedicated for the National Center for Mental Health, which treats patients with mental illness; 2 systems dedicated for the National Tuberculosis Hospitals, which treats tuberculosis patients; and 1 system dedicated for the Sorokdo National Hospital, which treats patients with Hansen’s disease.

System Features

Provision of functions for medical practice

The systems contribute to reduced length of patients’ waiting time, minimized manual work and cost-saving in document management, convenient information storage, easy access of medical personnel to patient’s records, and diversified usage of information.

Medical and nursing duties

- Real-time patient information or medical record retrieval and prescription enhance the efficiency of medical treatment and reduce duplicated work.
- Computerization of nurses’ manual work enables fast and better quality services.

Treatment support

The systems allow automated input and processing of medical images and examination results.

Hospital administration and assessment

The systems relieve the burden of information management work and instead promote fast reception and assessment of medical expenses.

Site Map

Patients’ treatment, nursing, treatment support, administration/assessment, and handling of certificates and medical records

Funeral Service Information System (e-Haneul)

This is the only government-operated funeral service information system, which manages the integrated operation of nation-wide crematorial facility reservations and cremation information, provides information on funeral service facilities, and handles administrative procedures of permission or reporting.

System Features

Comprehensive information on funeral service

- Information on the current status of funeral service facilities and prices of funeral supplies.
- Information on local governments' support for funeral service and provision of education for employees of funeral businesses

Cremation reservation via Internet and cremation information management

- Cremation reservation via PC or mobile
- Integrated management of cremation information of facilities throughout the country.

Provision of death information (200,000 persons on annual average)

The system provides death information to pension and social security institutions in a fast manner to prevent duplicated benefit coverage and leakage of government funds.

Crematorial facility management and funeral service-related administrative affairs

- Administrative affairs regarding funeral service establishment permit/license, management, and burial/cremation report management
- Administrative dispositions regarding management of funeral service establishments

Site Map

- Cremation reservation (mobile), price information on funeral service and funeral supplies
- Funeral service administration (license/permit, administrative restrictions, management of education required by law) and other services for citizens
- Facility operation (reception, redemption, extension), information registration (facility service fees, prices of funeral supplies, death information, employees required to undergo education)

National Pension Information System

This is a system for operation of the "National Pension Scheme", which is aimed at promoting the stable livelihood and welfare of the public by providing pension benefits for the old-age, disability, or death.

System Features

Integrated management of national pension

The system performs integrated management of individual consultation records and changes during the period from insured status acquisition to benefit receipt as lifetime history of customers.

Construction and operation of massive amount of data

78.1 billion data, accumulated for 3 decades, including the computerized resident registration data of the Ministry of the Interior and Safety, are used in operation of the national pension work.

Public services

The system offers 24-7 services, such as certificate issuance and estimated benefit inquiry, through interconnection with the website of National Pension Service.

e-Government serving as the base for educational and cultural development

Education / Culture

The Korean government is actively using the e-Government systems in implementing and reinforcing the responsibility and publicness of national education. Especially by achieving the educational informatization, where each of the schools, teachers and students can take the lead and participate, Korea has laid the groundwork for becoming an educational powerhouse. It has also developed systems for the integrated management of cultural assets and efficient handling of the related work, further extending its foundation for a cultural powerhouse.

Education / Culture

- 84 National Education Information System (NEIS)
- 85 Educational Information Sharing System (EDUNET·T-CLEAR)
- 86 Online Schooling System (Online School)
- 87 Government e-Learning Platform (*Nara baeumteo*)
- 88 Digital Administration System on Cultural Heritage
- 89 Korean Library Information System (KOLIS)
- 90 Central Archives Management System (CAMS)

National Education Information System (NEIS)

This is a major information system for educational administration in the Ministry of Education, 17 educational offices, and 10,000 elementary and middle schools in Korea. It handles online affairs regarding faculty HR and salary management as well as students' attendance and grade management, and provides service for students and parents, such as certificate issuance.

System Features

Streamlining of affairs in educational administration

The system brings various administrative procedures of educational institutions and offices online and provides a wide range of functions each year.

Data sharing

- The system provides statistics, collected through its internal business process.
- The system shares and processes data with educational offices and public institutions.

Service for citizens and mobile service

- The system offers 46 service types for students and 59 service types for parents (school meal menu, student records, etc.).
- Key school information, including academic calendar, school newsletter, meal menu, and timetable, is also provided as a mobile service.

Safe and secure information

- The system applies 7-step security measures on the network, servers and user PCs.
- It also requires online certificates to log in and uses separate authorization management framework for each business or menu to ensure that only the authorized uses the service.

Site Map

- 147 types of school affairs, such as management of student grades and records
- 102 types of general administrative affairs, such as management of faculty HR, salary and service
- 16 types of service for citizens, including online poll and certificate issuance.

Educational Information Sharing System (EDUNET·T-CLEAR)

This is an integrated support system that provides overall educational information, such as information on educational curriculums, teaching and learning, evaluation, and activity materials, and facilitates collaboration and communication.

System Features

Support for teaching and research activities of teachers

- The system provides teaching materials, such as materials for planning, teaching and learning and research as well as outside materials, which follow the educational curriculum
- It is a centralized, unified original data collection system (reinforcing educational information sharing with local educational offices).

Integrated provision of educational policy information

- The system brings scattered educational policy information together, such as the national curriculum, National Competency Standards (NCS), and the free-semester scheme.
- It also provides information (services, trends and statistics) for educational policies to smoothly settle into the field.

Integrated search on educational information

The system provides materials required for implementing educational policies, like digital textbooks and materials for IT ethics education.

Educational material sharing and communication

The system offers an online community for teachers called "NanumGongan" for communication and information sharing.

Site Map

Teaching/ research materials, educational curriculums, free-semester scheme, digital textbooks, cyber learning, software education, research competition, Wedorang (learning community service), teacher training, local educational information service, etc.

Online Schooling System (Online School)

This remote schooling system provides online educational programs that are difficult to be operated by schools to ensure students' right to learn and choose subjects. Learning results at the Online School can be applied in the official student records.

System Features

Learning contents developed upon the regular school curriculum

The system provides a wide variety of learning contents on each of the 56 middle school subjects and 45 high school subjects.

Student's learning status monitored by many stakeholders

The system allows many stakeholders—a school teachers, subject tutor helping the student with studies, and educational officers who plan educational policies—to conveniently check the learning status of the student.

Improved user convenience through mobile service

The system also allows PC and mobile-based learning by applying responsive web technology.

Learning activities in the system accepted as regular schooling records

The results of learning on the system are reflected in the official student records.

Site Map

Online course guide, learning status, homework, library, notice, Q&A, SMS, sign up for courses, and class classification

User

Middle and high school students who are enrolled in regular schools but

- Have not completed a certain part of the curriculum due to moving or transfer
- Want to learn subjects that are not available at school

Government e-Learning Platform (Nara baeumteo)

This system offers public officials smart e-learning programs accessible anytime, from anywhere to support their self-improvement. It is a platform shared throughout the entire government, where the central and local educational and training institutions share the learning contents and systems.

System Features

All-In-One service enjoyed anytime and anywhere

- The system provides 24/7 learning contents that can be used freely via PC or mobile anytime, from anywhere.
- Users can search and learn all e-learning courses of central and local educational institutions and complete the courses on the platform in one stop.

Big data-driven service

The system recommends matching courses for the level, sector, job and interest of each public official based on big data analysis.

Flexible and scalable learning platform that is shared government-wide

The system allows all central and local educational institutions (90 institutions) to share the system and contents.

Site Map

e-Learning search/ learning/ completion, big data-based recommendation for each user, collaborative learning (community, blog, knowledge Q&A), and contents and system sharing

Digital Administration System on Cultural Heritage

This shared system covering the entire process of cultural heritage administration offers digitized administrative procedures and automated records among collaborating organizations, such as the Cultural Heritage Administration, local governments, investigating agencies, and groups owning intangible cultural heritage.

System Features

Collaborative portal

The system collaborates with earth surface inspection and excavation agencies, clinics treating natural monuments and groups owning intangible cultural heritage, to electronically support related business procedures.

Electronic administration

The system ensures online connection of local governments to Cultural Heritage Administration for administrative support.

Administrative portal

The system provides links to various information systems for cultural heritage administration for reservation and information sharing.

Site Map

Designation and revocation, Cultural Heritage Committee, regular investigations, national treasure/ repair and maintenance, alteration of the current state, ground excavation, national intangible cultural heritage, palace and tomb heritage, and natural monuments

Korean Library Information System (KOLIS)

This system facilitates various forms of resource management and library affairs of the National Library of Korea. The system was developed as a client-server system in 1999, redeveloped into a web-based one in 2015, and then launched as KOLIS II in October 2016 as an upgraded, extended and user-oriented version.

System Features

Key functions for library affairs

The system performs major library affairs such as resource collection, registration, arrangement, and lending based on the Libraries Act.

Printed and online materials

Librarians follow the integrated format for bibliographic data of Korean Machine Readable Cataloging (KORMARC) for data input and management of printed materials, and Metadata Object Description Schema (MODS) for online materials.

National Library KOLIS II

The system is playing the pivotal role in the national library resource management based on interworking with other information systems – integrated search system of the website (www.nl.go.kr), KOLIS-Net (nation-wide libraries network of holding materials), and the Korean Old and Rare Collection Information System (KORCIS).

Central Archives Management System (CAMS)

This is a permanent archives management system of the National Archives of Korea (an institution with the overall control and supervision of public record management of Korea), which manages permanent archives of national significance which need to be preserved for 30 years or more.

System Features

Archives management standard provision

The system adjusts and approves record preservation period for each unit task of government affairs and provides the standard table for search.

Acquisition and registration of records

The system handles the acquisition process of records from archive institutions or registration of records collected from the private sector or abroad.

Record preservation and management

The system performs management of inbound/outbound records, library management, inventory, digitization, description, preservation period re-assessment, and re-classification of records for disclosure.

Perusal and utilization of records

The system offers functions for search and perusal of the archives in their original form.

e-Government supporting growth of businesses

Industry / Procurement / Employment

Korea has built the cutting-edge informatization systems for each industry. e-Government systems are applied to all areas of business activities, including procurement, patent administration, employment and customs clearance. These systems contribute to reducing administrative burden on businesses, saving cost, and improving business competitiveness.

Industry / Procurement /
Employment

- 94 Electronic Customs Clearance System (UNI-PASS)
- 95 Intellectual/Industrial Property Office Automation System (KIPOnet)
- 96 Korea Intellectual Property Rights Information Service (KIPRIS)
- 97 Government-for-Business (G4B) System
- 98 Employment Information Platform (Work-Net)
- 99 SME Support Administration System
- 100 Business Information System for SMEs (Bizinfo)
- 101 Korea ON-line e-Procurement System (KONEPS)
- 102 Government e-Shopping Mall
- 103 RFID-based Public Goods Management System
- 104 Korea e-Catalog Information System
- 105 Procurement Procedure Management System
- 106 Subcontracting Management System for Procurement

Electronic Customs Clearance System (UNI-PASS)

This system automates all customs procedures, for example, export/ import declaration, travelers' customs procedures and tariff payment for electronic processing, without requiring service users to pay visits.

System Features

Fast and safe procedures for customs clearance

The system enables all customs procedures to be done electronically without requiring visits, allows fast processing of customs affairs, and ensures safety with an advanced risk management module (Average time required per procedure: 1.5 minutes for export, 1.5 hours for import).

Integrated and interconnected system

The system provides one-stop shop services on all customs procedures by integrating and interconnecting the Customs Service, related institutions and stakeholders and also offers real-time information on trade and logistics.

Application of international standards

The system applies e-document standards of WCO and UN for worldwide use.

Site Map

- E-Declaration : Electronic declarations on export/ import, refund, freight, airport and seaport surveillance, travelers, FTA and other customs administrative procedures
- Customs Single window : Information on how to fill out application forms, progress check, and verification by head of customs office
- Others : User support regarding e-payment, distribution history reporting, e-commerce reporting, AEO and more

User

Korea Intellectual Property Rights Information Service (KIPRIS)

This is a major search system for intellectual property rights information, which provides the intellectual property rights information of home and abroad, owned by Korean Intellectual Property Office, for free search and view on the Internet by citizens.

System Features

Information search on intellectual property rights

The system provides 93 million cases of intellectual property rights information of home and abroad, owned by Korean Intellectual Property Office, in categories of patents, utility models, trademarks, and design, along with a service enabling search by category, sentence and more.

Various functions for user convenience

The system offers various functions for user convenience, including online download, mailing service on new information, and API-based patent search.

Information on issues and services regarding intellectual property rights

The system publishes and provides a webzine on intellectual property rights issues, along with various materials for a user guide.

Mobile service

Search service is offered also on mobile for user convenience.

Government-for-Business (G4B) System

This system provides easy and convenient services for businesses by integrating administrative services for businesses, which had been operated by different government and public entities.

System Features

Service for businesses

The system provides business information service (4,500 types) dispersed in different government and public organizations and online application and inquiry service (1,500 types).

Integrated portal for business information changes

This system offers an integrated service where businesses can handle necessary procedures (regarding changes in motor vehicle registration, 4 major insurances, patent, etc.) to make changes in their registered information (name, location, and business type) via the Internet all at the same time.

Hub of certificate distribution from test to certification

The system offers a convenient flow of services where businesses can apply for product performance test, inspection and correction, and request for online certificates and print them out (connected to some 270 test institutions).

Employment Information Platform (Work-Net)

This system or platform is operated by the Ministry of Employment and Labor and Korea Employment Information Service. It offers contents for career or employment support such as public/private job information, employment policy information, job placement, etc.

System Features

Interconnection to job information network of public and private sectors

Interconnected to 31 public and private job search websites, including systems of Ministry of Personnel Management, Human Resources Development Service, Military Manpower Administration and Ministry of the Interior and Safety, Work-Net provides all employment information at a one-stop shop.

Customized job information search

The platform enables customized job search by location, age, salary, working condition, number of employees, etc.

Vocational aptitude and psychological tests

The platform provides a total of 23 types of tests for youths (10) and adults (13), helping them find their vocational preferences, aptitudes and values.

'Work-Net for Youths', customized to young job seekers

The platform provides information targeted toward young job seekers, such as field report from small yet competitive companies, job introduction videos, and guides to writing self-introduction letters and preparing for interviews.

Mobile service

The platform offers services on vocational preference test, resume management, customized job search, and application support particularly optimized for mobile environment.

SME Support Administration System

This system performs integrated management of information on SME aid programs of the central and local governments and their beneficiary SMEs, in order to prevent duplicative aid or support and deliver customized policy information.

System Features

Integrated management of SME information

The system registers and manages information on SME aid programs of the central and local governments as well as the beneficiary SME information.

Information objectivity ensured through inter-ministerial collaboration

- The system acquires objective information through inter-ministerial collaboration when collecting beneficiary SME information.
- It collects SME information from National Tax Service (sales, establishment/ closing dates, holidays), Ministry of Employment and Labor (number of the insured workers by the Employment Insurance), and Korea Customs Service (export)

Statistical analysis function embedded

The system is embedded with an analysis function of various statistics using the collected information.

Site Map

- Information search : SME aid programs of central and local governments and application history and management performance of individual SMEs
- Management analysis : Growth rate analysis of sales, employment and export by year, project area and individual SME
- Statistical analysis : Multi-dimensional statistical analysis by program organizer, program area, business history or type, using the database on application history and management performances

Korea ON-line E-Procurement System (KONEPS)

This is a comprehensive online system that performs the overall management of government procurement business, including bidding, contract-signing, and payment regarding commodities, services and construction as needed by the central and local governments and public institutions.

System Features

E-bidding and contract signing

- Supplier companies can participate in all public biddings through one-time registration to the system with their qualification information including their license or permit.
- The whole procedures of procurement are handled online-bid opening, qualification examination, decision of successful bidders, contract signing and payment.

E-payment

The system handles the whole payment procedures-inspection on product/ service/ facility, billing and payment-based on interconnection with the major finance information systems.

Public procurement data sharing and management

The system is connected to the data of 195 credit rating institutions, surety insurance companies and more, to reduce the burden on businesses having to visit and enable paperless information check on public institutions.

Site Map

Bidding notice information, supplier company registration, central government procurement request, bidding participation, qualification examination, contract signing and management, contract information search, inspection, and payment

User

Central government, local governments, public institutions and supplier companies

Government e-Shopping Mall

This is an online shopping mall for public e-procurement, where the Public Procurement Service (PPS) signs short-term contracts with suppliers and the central/ local governments and public institutions can search items and make direct purchases. This system aims to support the fast procurement of commercial, quality-assured commodities for the government and public organizations.

System Features

One-click purchase of commodities based on PPS unit price contract

The system enables purchase or sale of commodities on fixed price contracts with PPS, allowing the end-user institutions to purchase commodities more easily.

Fast purchase

End-user institutions can purchase the commodities they need at one click of the KONEPS mall without going through competitive bidding procedures.

Provision of E-Shopping Mall information

The system provides legal information on procurement contracting and the system user manual, which many officials of end-user institutions may want to know.

Site Map

- Search on commodities included in the unit price contract with PPS (search by supplier name, commodity name, product serial number, etc.)
- Search by property information (size, unit, area, certification, etc.)
- Commodity category-based composition of the mall (automobile, PC, furniture, etc.)
- Provision of various certified sections for technology development products and green, eco-friendly products

User

- Users who can purchase commodities : end-user institutions registered in PPS (central/ local governments and public institutions)
- Users who can register commodities : companies registered as bidder in PPS and signed unit price contracts

RFID-based Public Goods Management System

This is a system for real-time, wireless tracking and management of commodities using attached RFID tags for the entire commodity lifecycle of acquisition, custody, use and disposition in order for efficient management of government goods.

System Features

Stocktaking using RFID technology

Stocktaking is done using RFID tags, attached to commodities and scanned by portable readers, which data are transferred for stocktaking and tracking the flow of commodities.

Statistics and register management

This system conducts management of not only registers for commodity acquisition, custody and disposition but also statistics by classification and item using the commodity list numbers as defined by the Public Procurement Service.

Examination of commodity management by operating agencies

This system offers functions for inquiry and statistical analysis on the current status of commodity possession by each organization, stocktaking results, and other data for institutional evaluation.

Interworking with dBrain and On-BID

The system interworks with the digital budget and accounting system, dBrain, for management of commodity acquisition and with the electronic commodity disposition system, On-BID, for commodity sale.

Site Map

Tag issuance, stocktaking using RFID readers, commodity register management, commodity statistics, transfer of management to PPS without compensation, and commodity disbursement and return

Korea e-Catalog Information System

This system efficiently classifies, identifies and numbers government goods based on particular standards and methods, and efficiently manages the information to promote a nationwide use.

System Features

Management of commodity numbers

Commodity list information (classification and identification numbers) on 3 million government commodities, which are classified using the UNSPSC, are registered and retrieved in the system. The commodity identification numbers are given in as much detail as to determine the model number and manufacturer of the commodity, and properties (size, color, material and purpose of use) are also managed in the system.

Commodity information search function

This system offers a wide range of search functions, including the commodity classification map, search by classification, and search by manufacturer or model.

Basic information on national commodity management and public procurement

- Basic information for managing the process from commodity acquisition to disposition
- Basic information on commodity transaction through e-biddings, e-contracts and shopping malls

Procurement Procedure Management System

This is a streamlined, efficient government-wide online service system for integrated management of project ordering and receiving process, from project planning to proposal writing, proposal submission and proposal evaluation.

System Features

Proposal request service

The system provides standard templates for ordering institutions to efficiently prepare proposal requests and also provides support services in finding and using high-quality project proposals as well as making statements.

E-proposal and e-evaluation service

- The system allows bidders to submit the electronic version of technical proposals online, which had been in the form of printed materials before.
- The system handles evaluation affairs on all PPS projects (service and goods) within the range of system functionalities in order to ensure fairness and efficiency of technical review of the proposals.

Project management support service

The system offers standard procedures and guidelines for officials with no experience in IT project management to easily perform their duties.

Comprehensive information service

The system provides statistical information on biddings and contracts of all negotiated contract-based projects, as well as information on the latest policies, laws and standards for IT projects.

Site Map

Ordering support, proposal request, proposal, proposal evaluation, project management support, comprehensive information service, notice, bid-open result, and service fee guide

User

Central and local governments, supplier companies, evaluators and citizens

Estimated Development Period

23 months

Estimated Development Cost

USD 6 million

Subcontracting Management System for Procurement

This is a management system designed to prevent illegal subcontracting activities of principal contractors. This system allows principal contractors to handle the entire subcontracting procedures online, including conclusion of contracts and payment of subcontract consideration, material/equipment prices and service fees.

Public institutions placing orders monitor the whole process online.

System Features

E-Contract system

Principal contractors conducting public works or projects and subcontractors register themselves in the system for online subcontracting procedures.

Payment and monitoring

The system supports e-payment of subcontract consideration, materials and equipment prices and service fees, enabling the client public institutions placing orders to monitor such payment.

Subcontracting records certificate issuance

Upon request of subcontractors, the system allows them to retrieve their subcontracting records and issues online certificates.

Site Map

Contract management, payment, exemption, bank account management, status management, user management, portal management, guarantee certificate management

User

e-Government protecting safety and lives of citizens

Safety / Environment

Safety / Environment

Protecting the safety and lives of citizens is the most crucial role of a government. As part of its proactive measures to protect citizens from disasters, the Korean government has developed and operated systems for managing the environment and preparing for disasters. These systems have enabled the prevention of and prompt response to disasters such as forest fire, earthquake, and landslide.

- 110 Korea 119 Multimedia Report Service
- 111 Disaster Scene Image Transfer and Monitoring System
- 112 Korea Safety Map
- 113 Safety Assessment System
- 114 Earthquake Early Warning System
- 115 Forest Fire Command Control System
- 116 Landslide Alarm System
- 117 Waste Treatment Management System (*Allbaro*)
- 118 Forest Resources Management System
- 119 National Forest Management Information System
- 120 Forest Engineering Management System
- 121 Forest Projects Management System
- 122 Forest Projects On-Site Support System
- 123 Forest Diseases and Pests Management System
- 124 Roadside Tree Information System

Korea 119 Multimedia Report Service

This system enables those in difficult situations to make calls or vulnerable to safety incidents, including the disabled and foreigners, to make emergency 119 reports via diverse media such as video, text and app.

System Features

Diverse 119 reporting means other than voice call

- **Video report** : The system accepts video reporting, which delivers accurate information of the reporter's location and situations; it can also communicate with the hearing-impaired using sign language.
- **Text report** : Users can make text reporting when in difficult situations to make voice calls or in voice service interruption; attachment of photos or videos facilitates fast and accurate responses.
- **App report** : Reporters can deliver their location information (GPS coordinates) even when they do not know where they are.

World's first emergency system to apply video call (3G and LTE) technology

Easy and convenient not only for those vulnerable to safety but also for the general public

As of 2017, there are more than 400,000 reports filed through this system.

Disaster Scene Image Transfer and Monitoring System

This is a monitoring system that transfers (on LTE or 4G) real-time images of disaster scenes, taken by imaging cameras installed in fire engines and helicopters, to the central situation center for monitoring.

System Features

Transfer and monitoring of disaster scene images

- Using the LTE mobile network, the system transfers images without restrictions of distance or location.
- All activities from a fire engine or helicopter dispatch to arrival to the scene are monitored at the central situation center.
- Images on indoor scenes where a fire engine or helicopter cannot reach are taken by mobile devices and sent to the central situation center through a smartphone app.

System configuration

- **Imaging cameras** : Remote pan-tilt-zoom (PTZ) cameras are installed in dispatched fire engines and helicopters (Camera operation on 615 fire engines, 28 helicopters and 195 mobile devices).
- **Image collection system** : This system collects and stores images transferred on LTE from dispatched vehicles or aircrafts.
- **Monitoring system** : This system performs image show, screen division, camera control, stored image play, etc.

Korea Safety Map

This is an easy-to-understand map system accessed through the Internet and the mobile app, which provides integrated disaster and safety information of different ministries so that citizens can cope with disasters or safety issues in their daily lives.

System Features

Thematic map service on 8 safety areas

The system integrates information on potential risks in daily lives of citizens into 8 areas (security, transport, disaster, customized information*, facility, industry, public health, and safety accident), and displays the information on the digital thematic map (2D/3D) through the Internet or the mobile app.

* Customized information means safety map information customized to women or children, who are vulnerable to safety issues, that is offered based on comprehensive analysis of relevant data, including crimes and transport safety.

Safety facility information service

The system allows users to find locations and contact numbers of major safety facilities, such as public facilities including the police and fire stations and emergency facilities like shelters and hospitals.

Safety report information service

The system displays potential risk information, as reported by citizens through the 'SafePeople' web/app and 'Safety Monitoring Volunteers Group', on the map for users to be aware of.

Site Map

Thematic map on safety areas, safety facility information, safety report information, Safety Index by local government

Safety Assessment System

This system collects and standardizes various safety statistics and measures Local Safety Index for each local government. This promotes safety competition among local governments and contributes to a reduced number of deaths caused by safety accidents.

System Features

Safety Index information

The system provides national/public statistics on 7 safety areas (fire, traffic, suicide, infectious disease, crime, safety accident, and natural disaster) and Safety Index ratings.

Safety assessment

The system performs safety assessment using indicators or spatial data.

Safety improvement consulting

The system recommends projects for safety improvement.

Site Map

Earthquake Early Warning System

This system analyzes the time, location and scale of earthquakes by using the P-waves only (P-waves spread about 1.73 times faster than S-waves).

System Features

Early analysis of earthquakes

The system uses real-time observation data and automatically analyzes earthquakes that cannot be forecasted.

Real-time monitoring through observatories

The system monitors the real-time status of each earthquake observatory to find any data abnormalities.

User notification service

The system automatically delivers the analyzed results to users based on certain standards.

Site Map

Real-time earthquake observatory monitoring, earthquake status monitoring, early analysis of earthquakes, and earthquake information delivery

Forest Fire Command Control System

This is a system for the integrated control of fire prevention and firefighting status. It supports step-by-step disaster control activities based on the standard procedures to cope with forest fires, and minimizes harm to human lives and property using the latest ICT applied for real-time detection and spread prediction.

System Features

Prevention and preparation

The system provides forest fire prediction information by converging big data on weather information with forest geographic information.

Response

- The system provides intelligent search function on geographic information for the analysis of the situation around the fire, and reporting function for sharing information on time-based control measures taken and damage status.
- The system detects forest fire using satellite information.

Recovery

The system provides forest fire statistics and the function of damage reporting.

Site Map

Forest fire report management, damage reporting, fire prediction, past fire outbreak analysis, firefighting equipment management, contact information management, SMS sending, and fire watcher search

User

Korea Forest Service and its affiliated agencies, local governments, related organizations, research institutions and citizens

Access

Internal Use Only

Landslide Alarm System

This system analyzes landslide prediction information and informs the citizens and public officials of the results in order to minimize the damage of human lives and properties.

System Features

Production and provision of landslide prediction information

The system provides landslide prediction information for each town or village by considering the rainfall distribution with the geological features and measuring the soil moisture index, which is the amount of rainfall infiltrated into soil.

Provision of action guide on erosion and statistics

The system offers useful information such as the landslide action guide for each season, current status of landslide occurrences, definition of landslides, etc.

Mobile service

The mobile landslide information app provides landslide prediction information and real-time alerts on the user's location.

Site Map

Landslide risk map search, landslide prediction information and alert search, citizens' action guide search, landslide statistics search, etc.

User

Waste Treatment Management System (Allbaro)

This is an IT-based, comprehensive waste management system that transparently manages the real-time process of waste discharge, transport and treatment via the Internet; and integrates life cycle management of wastes, including reduction of waste generation, recycling, and proper treatment.

System Features

Electronic waste transfer system

Waste discharge, transport and treatment reports are filed electronically, and e-receipts are used for waste transfer.

System interconnection

To improve user convenience, the system is interconnected to large-scaled treatment facilities, marine waste information system of Korea Coast Guard, local government administrative information system(Saeol) of Ministry of the Interior and Safety, e-payment system of Ministry of Environment, employment and labor management system of Ministry of Employment and Labor, and UNI-PASS of Korea Customs Service.

Provision of statistical information

The system provides environmental industry information, statistics, recyclable resources, and market trends. It also provides construction waste statistics, analyzed based on the accumulated transfer data of wastes.

Mobile app service

The system provides key services through its mobile app for convenience of users who have difficulty finding Internet access.

Site Map

Recycled aggregates, waste reduction information, waste statistics, customer support (manual/ Q&A/ reference), My Allbaro (membership sign-up, log in), etc.

User

Ministry of Environment and Korea Environment Corporation (as managers), citizens (as waste dischargers)/ transporters/ treatment business operators)

Estimated Development Period

24 months

Estimated Development Cost

USD 1.9 million
(USD 3.2 million/year for maintenance)

Award/ Recognition and Export

- Commendation for export to Vietnam as an e-Government system (2016)

Managing Organization

Korea Environment Corporation

Forest Resources Management System

This system supports administrative procedures for forest resource management in the field, such as afforestation, forest-tending, felling and sale, and manages forest project history using GIS.

System Features

Field support for forest resource management

The system standardizes the process of field work from project planning to follow-up management to achieve system-based performance.

Forest project design and automated cost estimation

The system automates complex calculations in collecting survey results, printing the results writing reports, and estimating project costs.

Accumulation and use of basic forest project data (field survey note data)

The system serves a foundation for big data use by accumulating all basic data (field survey note data) for implementation of forest projects.

Site Map

Afforestation, forest-tending, felling(harvest), sale of products

User

National Forest Management Information System

This is a comprehensive management system that provides GIS-based forest compartment status information, forest management plans, analysis, reporting and evaluation information to support the sustainable management of national forests.

System Features

Management planning and real-time monitoring support

- The system supports the planning of forest management by compartment and changing of the plans.
- The system offers diverse analytical functions for decision-making in forest management by using data on forest types, soil, volume, and project performances.

Business process system interconnection to manage the history of national forest management

- The system simplifies the process of performance management by interconnecting the integrated forest resource management system (for afforestation and forest tending) and the forest public works management system (for forest roads and erosion control).
- The system provides information on national forest management plans by interlinking business process systems.

Site Map

Establishment of management plans, revision of management plans, management analysis, management performance reporting, management evaluation, and income-related work

Forest Engineering Management System

This system handles history information on plans, management (planning, execution and supervision) and maintenance of forest engineering projects, such as forest road construction and erosion control work.

System Features

Standardization of on-site procedures

The system standardizes and handles business procedures of managers who work on site, from planning to maintenance, repair and inspection management.

Automation of forest engineering service expenses

- The system performs cost control and automated expense calculation for each stage of feasibility review, project planning, execution and supervision.
- It extracts quarterly/annual reports, provides links to the e-document approval system and SMS, and retrieves records on completed projects.

Interworking with the Forest Service Management System

The system receives details of project management from service contractors upon contract signing and registers such information in the Forest Service Management System for facilitated process.

Forest Projects Management System

This is a system where service companies contracted to provide forest engineering service in forest road construction or erosion control projects register and manage their service progress and outcomes. The system is operated in connection with the Forest Engineering Management System.

System Features

Step-by-step project management

The system standardizes the business process of planning, execution, supervision, and maintenance to increase the efficiency and accumulate data for project management.

Integrated information system accessible by service companies

As an integrated system for a broad range of forest projects (forest road construction, erosion control, afforestation, and forest tending), the system offers convenient access by service companies.

System built upon spatial information

Project outcomes and performances can be registered into the system as spatial data, establishing a history management framework.

Automated planning

The system allows planning procedures, for example, making output statements and specifications to be automated, and ensures convenience in the planning work.

Site Map

Support for procedures of planning, execution and supervision in carrying out forest projects such as afforestation, forest tending, forest road construction, erosion control, and forest surveys

User

Forest Projects On-Site Support System

This system integrates and operates various information on documents and devices required for work on forest sites, such as paper maps, paper survey notes, cameras and GPS, into a single mobile device, and supports a wide range of on-site business process.

System Features

Smart aerial photos

- The system integrates GPS or paper-based location functions into a mobile device.
- It identifies location, measures GPS areas, stores maps, and measures distances and areas.
- It also provides thematic maps used in aerial photos or other on-site works.

Smart field survey note

- The system transforms paper-based field survey into mobile electronic notes (21 types).
- Any redundant procedure on site, such as documentation of paper-based survey notes, is automated on mobile devices, further reducing the work load onsite.
- The system automatically reviews any data errors caused by manual input and ensures data accuracy.

PC-based program

The PC-based program is directly connected to mobile devices for data transfer and supports mobile app upgrades.

Site Map

Forest survey, standard lot diameter measurement, afforested area survey, forest damage assessment, forest product measurement, forest disease and pest survey, landslide vulnerable area survey, forest purchase review report, status survey on forest lease, and unauthorized occupation area survey

Forest Diseases and Pests Management System

This is a system for the efficient prevention of damages from the rapidly increasing forest diseases and pests and integrated map-based management of disease/ pest outbreaks, control measures and other general affairs.

System Features

Integrated management of business process regarding forest diseases and pests

The system provides support services for policy-making on step-by-step coping actions in the field such as preventive observations, investigations, planning of control measures, control projects, and reporting.

Monitoring service on disease/ pest outbreaks and control

The system provides the current status information on pine wilt diseases and manages outbreak and control of general diseases and pests by using GPS coordinates provided by related institutions and local governments.

Mobile service

The system allows users to report and provide information on forest diseases and pests to enhance their on-site response capacity.

Site Map

Investigations on disease/pest outbreaks, planning and conducting control measures, sample analysis, report management, transportation prohibited zones, current status of diseases and pests, and disease and pest information

e-Government contributing to information diffusion and sharing

Communication / Infrastructure

Communication / Infrastructure

Advancement in the information and communication technologies has led to the rapid development of the Internet, information processing, communication and transport technologies. Utilizing such technologies, Korea is developing systems for closing the digital divide between urban and rural areas, while expanding the information infrastructure for radio wave management, digitization of mail distribution and data sharing.

- 128 Information Network Village (Invi)
- 129 Open Data Portal
- 130 Radio Wave Management and Control System
- 131 Internet Post Office (ePOST)
- 132 Postal Logistics Information System (PostNet)

Information Network Village (Invil)

This system facilitates the broadband Internet use in farming, fishing, and mountain areas, which are likely to be neglected from informatization. It offers e-commerce features and various information contents.

System Features

Income increase

The system allows a direct transaction through e-commerce (on goods and experiences).

Community facilitation

The system is used as a tool for facilitating the resident communities with Invil news, webzine, and messenger functions.

Digital divide closure

It contributes to closing the digital divide by providing ICT educational contents for rural residents.

Mobile service

Major services are also available on mobile for user convenience.

Open Data Portal

This system offers all public data generated, acquired and managed by public institutions through a single portal, ensuring easy and convenient use of public data for citizens.

System Features

Public data disclosure

The system supports a fast search for wanted public data from 23,000 datasets in form of file data, open API and visualized contents.

Application for provision of public data

The system also offers a window for citizens to apply for provision of public data other than the data disclosed already.

Examples of public data use (use cases)

The system shares cases and examples where public data use led to the development of startups, web/apps and various services.

Site Map

Dataset (file data, open API, standard data), application for data provision, use cases, information sharing

Radio Wave Management and Control System

This system comprehensively measures radio spectrums and their direction for efficient management of radio waves as the major source for the 4th industrial revolution.

System Features

Status survey on radio frequency use

The system provides information on the radio frequency use and occupancy rates by specific condition (frequency, time, intensity, etc.) as measured based on the ITU-R recommended guidelines.

Detection of unauthorized radio stations

The system provides unauthorized radio frequency information by interconnecting to the radio stations authorization database and comparing the result of radio spectrum measurement against the authorization data for the band.

Radio direction finding

The system locates the source of radio waves using a 3-way detection method connecting the fixed station, mobile station and control system, and visualizes the direction with electric field strength on e-map.

Site Map

Radio spectrum measurement and analysis, radio quality measurement, status survey on radio frequency use, detection of unauthorized radio waves, and radio direction finding

Internet Post Office (ePOST)

This is a post office on the Internet, where all affairs regarding postal administration are handled online and more than 800,000 users visit every day.

System Features

e-Green posts

A customer registers the contents of a post on the Internet, and ePOST reproduces the contents in the form of a real post and delivers to the receiver.

ePOST shopping service

The system achieves one-stop shop online shopping for agricultural, livestock and fisheries products through post offices, distribution networks and call centers throughout the country, which all perform product consultation, order reception and distribution.

Inquiry service

The system allows customers to request parcel/EMS/post shipping, track shipment, and find postal codes and other inquiries.

Postal service on smartphone

Customers can use mobile postal service on their smartphones no matter what time or where they are.

Site Map

- Postal service : e-Green posts, cards for congratulations and condolences, stamps, etc.
- Request and tracking : Resale phone application, parcel/EMS, track-tracing, postal code finding, etc.
- Shopping service : Local specialty product sale, post office life mart, B2B, etc.

Postal Logistics Information System (PostNet)

This system is optimized for handling postal affairs, performing integrated management of the entire process of postal logistics, from collection to carriage and delivery.

System Features

Real-time handling of postal items

The system integrates the entire process of postal logistics from collection to carriage, delivery and track-tracing and handles near 4 billion postal items per year on a real-time basis.

Automated facilities and converged information systems

- Based on the information generated in the process of collection, postal items are automatically classified into different categories, which are then managed in the information system.
- Automatic collection and delivery services are achieved through the convergence of the system with automatic collection machine or the smart locker system.

Web-based real-time handling

- The system automatically relays the information generated in the collection stage to the carriage and delivery stages, enabling the real-time track-tracing service.
- It also provides delivery notifications and results through the Internet or smartphone.

Site Map

Integrated collection, parcel/EMS, carriage management, delivery management, track-tracing, sales management, postal data warehouse (DW), call center, situation control, etc.

User

42,000 workers in 3,500 post offices and 31 mail centers in Korea
